

### Questions for self-control

1. Describe the situation and options when it makes sense to use subroutines and functions.
2. Give the comparative characteristic subroutine and function.
3. Get organized calling subroutines and functions.
4. What are the ways of transferring data between software units.
5. Explain what a list of options. Give rules for data transmission via the parameter list.
6. Explain what shared memory blocks. Give rules for data transmission through shared memory blocks.
7. Give the structure of program units.
8. Describe the types of broadcasting of program units.
9. Explain the use of modules. Describe the types of broadcasting modules.

### Tasks for independent work

In the tasks, the following general information. Poisson's ratio for steel  $\mu = 0,3$ ; modulus  $E = 2 \cdot 10^5$  MPa.

The general formula for calculation is provided below:

1. The heat exchanger tube  $l = 0,6$  m radius  $a = 0.08$  m, thickness  $h = 0,0015$  under the influence of uniformly distributed bending moment  $M_0 = 0,22$  N · m and pererizayuchoyi force at the end  $Q_0 = 8$  H. Determine the displacement and stress  $\sigma_x$   $W_x$  outer surface of the tube at coordinates  $x = 0 \dots l$ . To calculate the length  $l$  divided in 40 parts.

Calculation  $W_x$ ,  $\sigma_x$  execute a subroutine;  $\varphi(\beta x)$ ,  $\theta(\beta x)$ ,  $\xi(\beta x)$  calculate the sub-functions.

2. Tubular reactor is pressurized reagent  $P = 18$  MPa. The diameter of the housing  $2a = 0,18$  m; length  $l = 1,75$  m, wall thickness  $h = 0,00085$  m. Determine the displacement  $U$  and bending moment  $M$  in 30 sections, evenly placed along the length  $l$  (the current coordinate  $x$ ).

The variables  $U$  and  $M$  define the sub;  $\varphi(\beta x)$ ,  $\theta(\beta x)$ ,  $\xi(\beta x)$  - take the form of functions.

3. Brief tubular shell length  $l = 0,18$  m diameter  $2a = 0,16$  m, thickness  $h = 0,018$  m is under external pressure  $P = 12$  MPa. Determine the pipe walls  $W$  move in 21 point coordinates  $x$ , evenly placed along the length  $l$ .

$\chi_1$ ,  $\chi_2$ ,  $\chi_3$  defined as a function;  $W$  - a subroutine.

4. The cylindrical tube is under external pressure  $P = 20$  MPa. Dimensions of pipes: radius  $a = 0,12$  m, wall thickness  $h = 0,01$  m. Determine the displacement  $W$ ,  $M_x$  moment load and  $Q_x$  in sections at a distance  $x = 0 \dots l$ , where  $l = 0,5$  m increments  $\Delta x = 0,012$  m.

$\varphi(\beta x)$ ,  $\psi(\beta x)$ ,  $\theta(\beta x)$  develop in the form of functions; power output values to draw a subroutine.

5. The case evaporating installation has the form of a cylindrical steel vessel diameter  $2a = 0,82$  m height  $l = 2,1$  m, wall thickness  $h = 0,011$  m. The density of the brine to install  $\rho = 1,3.103$  kg / m<sup>3</sup>. Identify move  $W$ , moment  $M$ , force, acting in a circle,  $N$ , are developing at a distance  $x = 0 \dots l$  increments  $\Delta x = 0,025$  m in the case evaporating installation.

$\theta$  and  $\xi$  defined as a function,  $W$ ,  $N$ ,  $M$  - a subroutine.

6. Drying unit has a cylindrical portion diameter  $2a = 1,3$  m length  $l = 1,8$  m, thickness  $h = 0,0125$  m. The ends of the cylindrical portion pivotally mounted. Inside installation develops working pressure  $P = 2,5$  MPa. Determine the displacement  $U$  and point  $M$  along the length of the cylindrical part ( $x = 0 \dots l$ ) increments  $\Delta x = 0,03$  m.

Determine the value of the sub  $c_1$  and  $c_2$ , and the value of  $c_h$  and  $s_h$  - vyznachyty a sub-function.

7. The cylindrical tank length  $l = 3$  m radius  $a = 1,1$  m, wall thickness  $h = 0,01$  m loaded by  $Q_0 = 5,1.103$  H and moments  $M_0 = 12,5$  N · m, which are evenly distributed on the edges. Define  $M_x$  moment according to the coordinates  $x$  ( $x = 0 \dots l$ ) the length of the tank with the step  $\Delta x = 0,125$  m.

To calculate  $c_1$ ,  $c_2$ ,  $c_3$  provide external functions,  $s_0$ ,  $s_1$ ,  $s_2$ ,  $s_3$  take the form of internal functions.

8. Ceramic ring length  $l = 0,6$  m radius  $a = 0,25$  m, thickness  $h = 0,006$  m are in the scrubber cooling evenly distributed under the ends pererizuyuchoyi force  $Q_0 = 8,2.103$  N. modulus  $E_k = 6.104$  MPa, Poisson's ratio  $\mu_k = 0,2$ . Determine the displacement  $U$  and point  $M$ , which occur in the ring at a distance from the edge  $x$  ( $x = 0 \dots l$ ). Calculation fulfill increments  $\Delta x = 0,025$  m.

The values of  $c_1$ ,  $c_2$ ,  $s_1$ ,  $s_2$  defined as a function,  $U$  and  $M$  to calculate a subroutine.

9. Determine deflection force  $Q$  and  $U$  in the case of the mill, made in the form of a hollow cylinder with a hinged edges if the pressure inside has weight  $P = 1,5$  MPa. Geometrical dimensions: length  $l = 2,8$  m radius  $a = 0,8$  m, wall thickness  $h = 0,0085$  m. Calculation fulfill increments  $\Delta x = 0,1$  m in length ( $x = 0 \dots l$ ).

The values of  $c_1$ ,  $c_2$ ,  $c_3$ ,  $c_4$ ,  $s_1$ ,  $s_2$  defined as a function,  $U$  and  $Q$  define a subroutine.

10. A cylindrical adsorber (length  $l = 1$  m, diameter  $2a = 0,032$  m steel wall thickness  $h = 0,009$  m) evenly loaded socket point  $M_0 = 12,6.10^3$  N · m. Determine the distribution of deflections  $W$  and  $M$  points in the case adsorber at a distance from the end  $x$  ( $x = 0 \dots l$ ) increments  $\Delta x = 0,05$  m.

The values of  $c_1, c_2, s_1, s_2$  define a sub-function,  $W$  and  $M$  - the sub.
